Student Result Management System - Project Report

Project Title: Student Result Management System

Project Type: Web Application with Database

Technology Stack:

- Python (Flask Web Framework)
- MySQL (Relational Database)
- HTML + Bootstrap (Frontend)
- VS Code (IDE)

Project Overview:

This web application allows users to search and view student academic results by entering a Student ID.

The system fetches and displays subject-wise marks using a relational schema built in MySQL.

Key Features:

1. Search result by Student ID
2. View subject-wise marks
3. Integrated with MySQL backend
4. Built using Flask and Bootstrap
5. Dynamic result rendering via HTML templates

Database Tables:

- Students (student_id, name, department)

- Subjects (subject_id, name)

- Marks (mark_id, student_id, subject_id, marks)

Working:

Users enter a Student ID. Flask handles the request, queries the database, and renders the result using Jinja2 templates.

Developed By: Rahul Prasad Vagu

Internship ID: TS-RISE-DBSM-2579

Completion Date: June 13, 2025

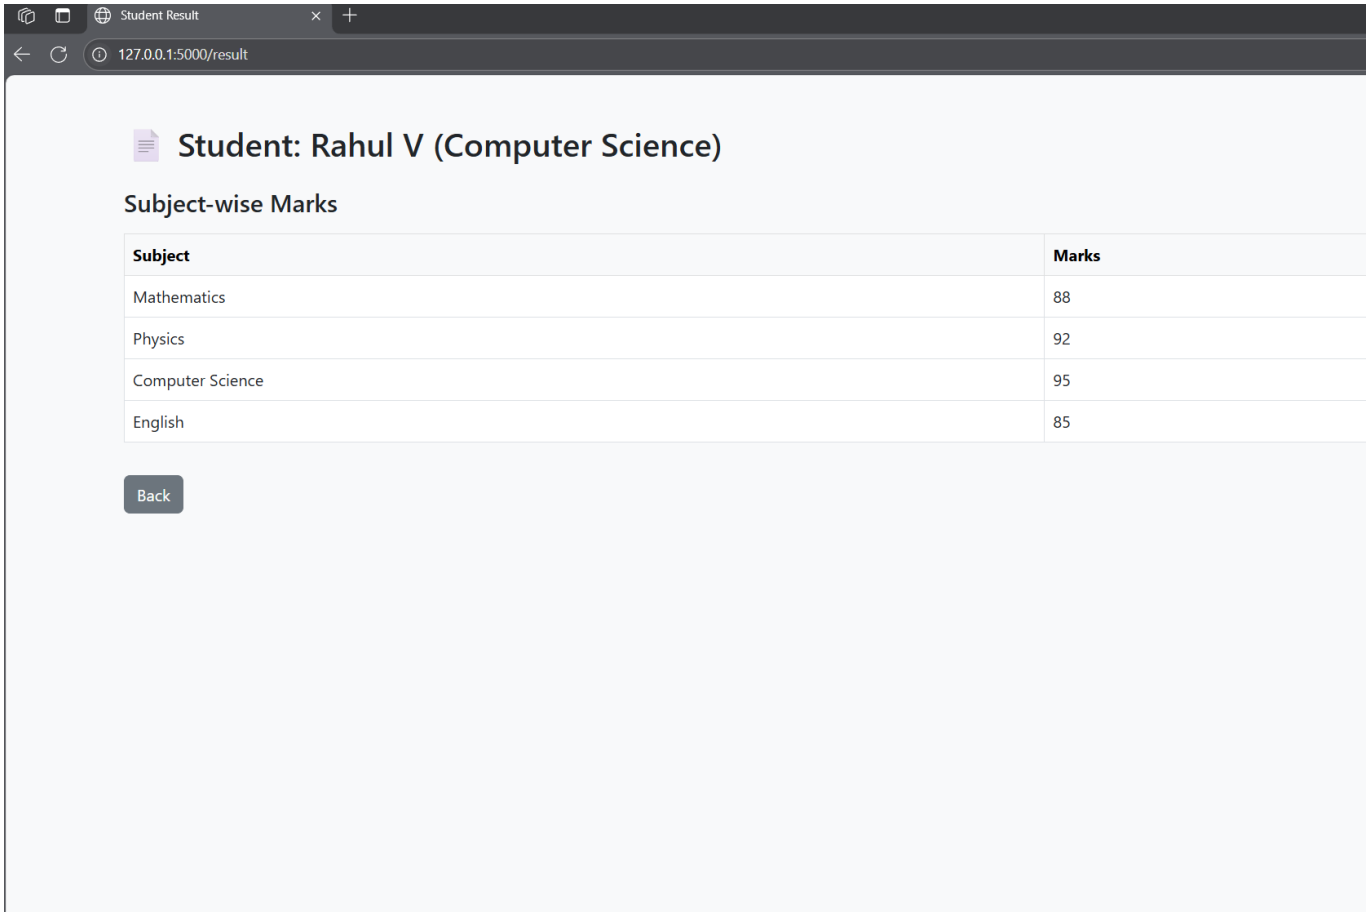
Student Result Display Page



Students Table in MySQL

Result Grid | Filter Rows:

student_id	name	department
1	Rahul V	Computer Science
2	Ananya R	Information Technology
3	Meera P	Mechanical
NULL	NULL	NULL

Subjects Table in MySQL

subject_id	name
1	Mathematics
2	Physics
3	Computer Science
4	English
NULL	NULL

Marks Table in MySQL

mark_id	student_id	subject_id	marks
1	1	1	88
2	1	2	92
3	1	3	95
4	1	4	85
5	2	1	76
6	2	2	81
7	2	3	79
8	3	2	67
9	3	4	72
NULL	NULL	NULL	NULL
